

Practical - 5

Corolla and Androecium

Corolla

1. No. of petals, (in figures)
2. choripetalous, or synpetalous, shape, size, apetalous (without petals)
3. choripetalous (with separate petals) type - ranceous, etc.
synpetalous (with coalescent petals) type - tubular, etc.
3. aestivation of the corolla, valvate, imbricate, etc.
4. colour of the petals.
5. inferior or superior.

Use the place of calyx and corolla when these two whorls are undifferentiated (identical in shape, size and colour)

Monocot,

Androecium

1. No. of stamens (in figure) uni- or bi-seriate
2. polyandrous (free) or no. adelphous (filaments fused) or syngenesious (anther fused only) or synandrium, (both filament and anther fused into a single mass)
3. alternate, antipetalous, or obdiplostemonous, (relation and position of stamens to petals).
4. epipetalous (in gamopetalous flower: exceptionally polypetalous ones) Epiphyllous (when perianth undifferentiated)

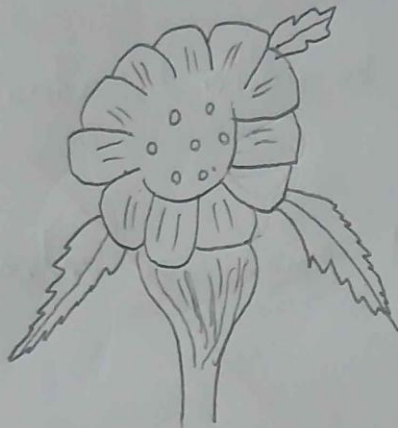

Corolla

Forms of Corolla

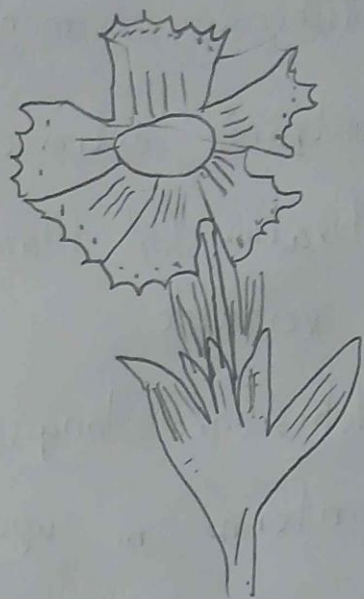

Actinomorpha

Cruciform

rosaceous

caryophyllaceous

campanulate

funnel-shaped

Zygomorphic

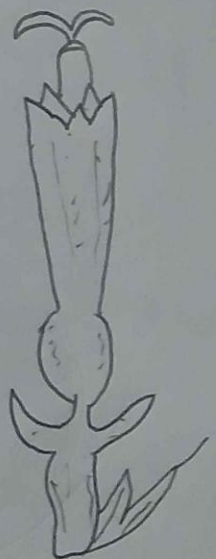

bilabiate

ligulate

papilionaceous

tubular

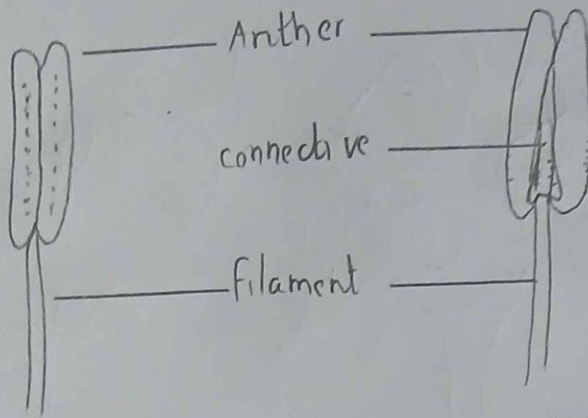

5. filament length - di- or tetra - dynarⁿous or nature of the filament, short, or long, etc.
6. ditheous or monothecous,
7. introrse, extrorse or latrorse,
8. fixation (of filament to anther) - adnate, dorsifixed, basifixed or versatile
9. dehiscence - longitudinal, porous, or valvular, or transverse,
10. inferior or superior.
