Practical - I

Study, draw, label and write short notes on the following
External features of Nereis (Clamworm)

Phylum - Annelida

Class - Polychaeta

Order - Phyllodocta

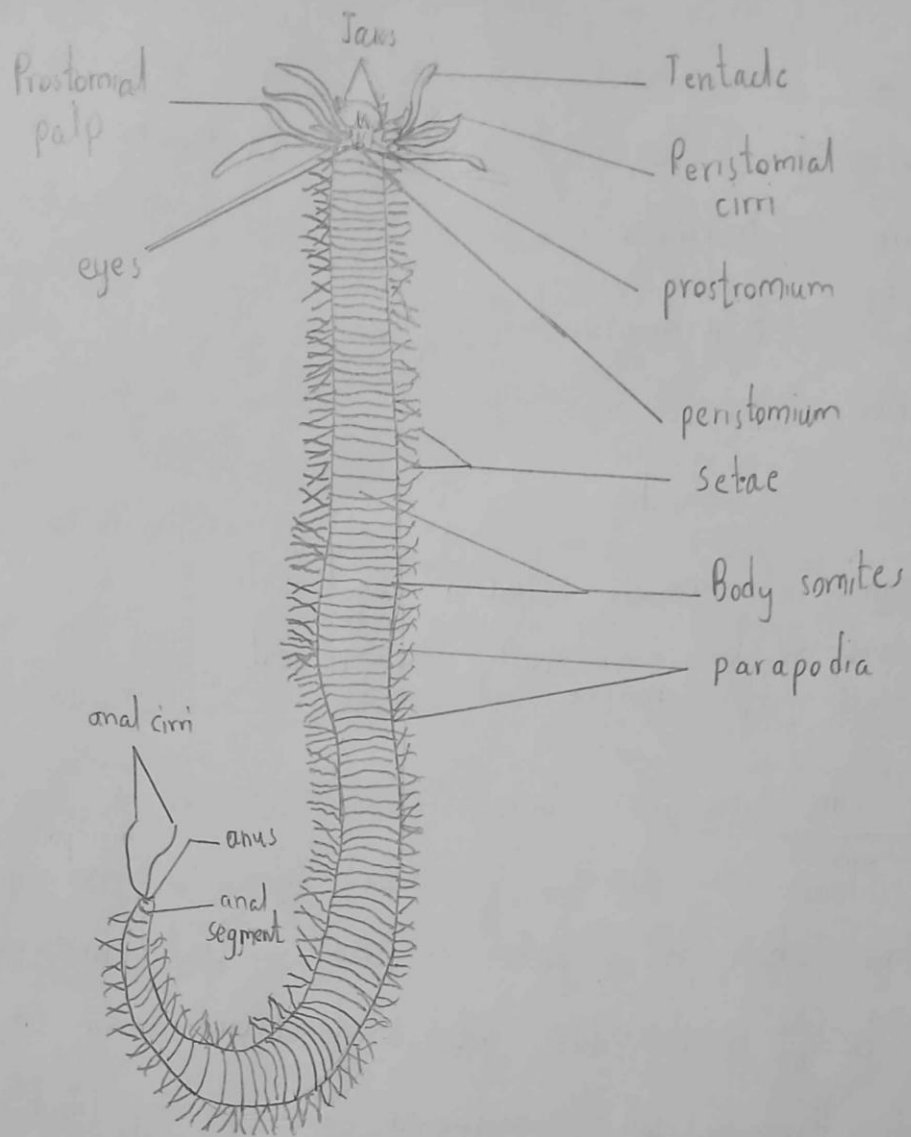

Family - Nereididae

Genus - Nereis

- The body is divided into head, trunk and pygidium.
- Head possesses a distinct two parts, prostomium and peristomium.
- Prostomium : anterior, triangular fleshy outgrowth
- Peristomium : large ring-like structure

Sensory appendages and organs of head

- Prostomial eye - four simple black and rounded eyes
- Prostomial structure - a pair of short tentacles
- Prostomial palps - two in number, short, stout, fleshy, two jointed ventrolaterally.
- Nuchal organs - ciliated pits, lying on each side of prostomium
- Peristomial cirri - four, two dorsal and two ventral.
- Trunk - Posterior to the head, 80-100 segments, known as metameres or somites
- Pygidium - last segment of the body, elongated, swollen, bears a terminal anus.
