

Study, draw labels and write short notes on the following.
External feature of Rana tigrina

Phylum - Chordata
Class - Amphibians
Order - Anura
Family - Dicroglossidae
Genus - Rana
Species - R tigrina

- Body is divisible into head and trunk. Neck and tail are completely absent.
- Head is triangular, dorso-ventrally compressed and possesses a pointed snout.
- Nostrils or external nares are small openings situated at the anterior end of the snout.
- Eyes are large and seen protruding from the dorso-lateral sides of the head.
- Each eye is guarded by two eyelids, an immovable upper eyelid and a semi-transparent movable lower eyelid.
- The lower eyelid is formed of a lower eyelid proper below and a nictitating membrane above.
- Tympanum or ear-drum is more or less circular area found posterior to each eye.
- Mouth is a wide opening at the anterior and bounded by upper and lower jaws.
- Trunk forms the major portion of the body and contains fore limbs and hind limbs.
- The foot is well developed and has a remarkably elongated ankle and five digits.
- A well developed web is present between the digits.
- Vent or cloacal aperture lies at the posterior end of the trunk.
